----- R6RS Scheme interpreter Version: 1.1e Date: 2015-05-16 This is a version that I consider a legitimate alpha because of some limitations that is not intended to be a production version. The work on this alpha will continue, but if you find a bug or request a feature, you are welcome to report it at the GitHub issues page here. About this package Package r6rs-via-mosh is a work in progress (alpha) implementation of R6RS Scheme interpreter based on Mosh. R6RS is a collection of features for a standard module system, such as syntax for defining host languages based on Scheme. As an implementation of the R6RS it means that libraries and the core language share a common module structure. In the R6RS Scheme application, the Scheme interpreter is derived from the library, and a description of the programming language is available in the built-in help of the language. The language specification is very available, but the implementation must be quite simple and fast. Mosh is a Fast R6RS Scheme interpreter. R6RS features a standard module system, allowing a split between the core language and libraries. The application is fast and simple to use. To get to work, just follow the components the Command Line interface shows. Package mosh Description Fyi: Packages are here for compatibility with yacc, which many SYSV systems still use.
